# $Lecture Doc^2$ Tutorial

Author: Prof. Dr. Michael Eichberg

Version: 2.1

1

### Introduction

LectureDoc is an authoring system for creating lecture material; i. e., lecture slides, notes and exercises from a single document.

A single LectureDoc document contains discussions of topis which are then used as templates for creating advanced slides as well as a standard document. LectureDoc is intended to be used in combination with rst2ld (reStructuredText to LectureDoc) which is a tool that converts reStructuredText documents into LectureDoc and makes authoring slides as easy as writing a text document.

This tutorial is written in reStructuredText (*rst* in the following) and can be used as a template for creating your own lecture slides. The *code* of this tutorial is available on GitHub: https://github.com/Delors/re-StructuredTextToLectureDoc2/blob/main/ld\_base\_example.en.rst.

2

### **Basics**

A basic slide consists of a (section) header and some reStructuredText content.

```
Basics
-----

A basic slide consists of a (section) header
and some reStructuredText content.
```

3

## **Embedding Formulae**

Embed math equations using reStructuredText's default directive (... math::) and role (:math: `... `).

# Example The following

#### The following rst fragment:

```
Computation in :math: GF(2):
1
2
   .. math::
3
4
5
       \begin{matrix}
            1 + 1 & = 1 - 1 & = 0 \\
6
            1 + 0 & = 1 - 0 & = 1 \setminus
7
            0 + 1 & = 0 - 1 & = 1
8
9
       \end{matrix}
```

#### Will render like this:

#### Computation in GF(2):

$$egin{array}{lll} 1+1&=1-1&=0 \ 1+0&=1-0&=1 \ 0+1&=0-1&=1 \end{array}$$

5

You can use no-title in combination with the class directive to avoid that the title is shown on the slide/document. However, the title is still used for indexes.

```
Example

1 .. class:: no-title
2 
3 I will only show up in an index...
4 -------
```

### **Animation**

Basic appear animations can be created using the (CSS) class incremental[1]. You can also define a corresponding custom role (. . role:: incremental) to animate parts of a text.

```
Example
 1 Animation
    -----
 2
 3
 4
    Basic *appear* animations can be created using the (CSS) class
 5
     ``incremental``. You can also define a corresponding custom role
    (``.. role:: incremental``) :incremental: to animate parts of a text.
 6
 7
 8
     .. example::
 9
        :class: incremental
10
11
```

[1] Animation progress can be reset by pressing the r key.

6

### Animation of Lists

In case of (un-)ordered and definition lists (o1 or u1 in HTML) it is sufficient to associate the class incremental-list using the class directive with the list. It is also possible, to only specify the incremental class attribute for the required list items.

### Slide Dimensions

The slide dimensions can be controlled by specifying the corresponding meta information. If not specified, the dimension is set to  $1920 \times 1200$  (default); i.e., a ratio of 16:10.

#### Example

### In HTML documents add the following meta tag:

```
<meta name="slide-dimensions" content="1600x1200">
```

In reStructuredText documents add at the beginning:

```
.. meta::
:slide-dimensions: 1600x1200
```

8

9

## Associating a document with a unique id

Many functions in LectureDoc2 - e.g. persistence of the slide progress - require that a document is associated with a unique id. This id can be set using the meta directive. If no id is set, the respective functions are not available.

## Adding Supplemental Information

Adding information that should not be on the slides, but provide additional information/explanations, can be added using the supplemental directive.

#### **Formatting Slides**

Creating heavily formatted slides is easily possible using rst directives and roles which are mapped to CSS classes.

10

# 1. Structuring Documents

# **Creating Sections**

Creating a slide which marks the beginning of a new section can be done using the new-section class.

### Slide Transitions

Slide transitions can be controlled using the transition-... classes[2]:

```
transition-fade
```

- transition-move-left
- transition-move-to-top
- transition-scale
- transition-flip

```
txample

class:: transition-move-to-top
2
```

3 Slide Transitions

[2] See the LectureDoc2 Cheat Sheet for a comprehensive list of predefined transitions.

# Adding Code

2 print(i)

Adding code can be done using reStructuredText's code directive.

### Links to External Resources

LectureDoc2 supports links to external resources:

- https://github.com/Delors/LectureDoc2
- LectureDoc2 Sourcecode

```

## Links to Internal Targets

LectureDoc2 supports links to external resources:

- The title of a slide can be used as a link target → Advanced Formatting
- An element which is explicitly marked as a target can be used as a link target:
  - **Link Target in Incremental Block**

```
Example
Slide with explicit
                                                                 References are defined as follows:
marked-up element:
                                                                    Links to internal targets:
                                                                 2
1
  Adv. Formatting
                                                                     - Link to slide: `Adv. Formatting`_
                                                                    - Link to a marked-up element:
3
                                                                 5
   .. container:: incremental
4
                                                                       `Link Target in Block`_
5
6
     _Link Target in Block:
7
     See the LectureDoc2 Cheat Sheet.
8
```

## Scientific Citations

Citations are fully supported in LectureDoc2.

A reference to a book: [Martin2017] (Details are found in the bibliography (see next slide)).

```
Example
A reference to a book: [Martin2017]_
```

# Bibliography

[Martin2017] Clean Architecture: A Craftsman's Guide to Software Structure and Design; Robert C. Martin, Addison-Wesley, 2017

**...** 

```
Example
```

```
.. [Nartin2017] Clean Architecture: ...; Robert C. Martin, Addison-Wesley, 2017
```

18

# Advanced Formatting

LectureDoc comes with a set of predefined (CSS) classes that can be used to format the slides. Some of these classes have explicit support by LectureDoc and will be rendered differently in the different situations (e.g., document view vs. slide view will render *stacked layouts* or *supplemental information* differently).

- red
- peripheral
- obsolete

See the LectureDoc2 Cheat Sheet for a comprehensive list of predefined CSS classes.

19

# Stacked layouts

Stacked layouts enables updating parts of a slide by putting the content into layers and then showing the layers incrementally.

```
Example
1
   .. dech:: monospaced
 2
 3
      .. card::
 4
 5
       :gray: `This text is gray.`
 6
 7
      .. card:: overlay
 8
 9
       XXXXXXXXXXXXXXXX
```

### Presenter-Notes

Presenter notes can be added to a slide using the presenter-note directive.

A presenter note - including its presence - is only visible after entering the master password (press m and then enter: 123456).

# Integrated Exercises

Exercises can be integrated into the slide set.

### Example 1.1. Exercise: 1+1 Compute: $\sqrt{2} = ?$ To unlock the solution go to the document view (press c) and enter the password (sqrt). .. exercise:: Exercise: 1+1 1 2 3 4 5 .. solution:: 6 :pwd: sqrt 7 Solution: :math: 1,4142135624.

If you have multiple exercises, you can define a master password (123456) to unlock all solutions at once (press m to open the dialog).

```
.. meta::
    :master-password: 123456
```
