Version: Work in Progress

Admonitions

Standard reStructuredText admonitions: attention, caution, danger, error, hint, important, note, tip and warning

LectureDoc2 specific admonitions: background, definition, proof, theorem, lemma, conclusion, observation, remark, summary, legend, repetition, question, answer, remember, deprecated, assessment, and example.

Examples

Generic Admonition with Custom Title This is a generic admonition.	Background This is a background admonition.	Remark This is a remark admonition.	Deprecated This is a deprecated admonition.
Attention! This is an attention admonition.	Definition This is a definition admonition.	Example This is an example admonition.	Assessment This is an assessment admonition.
Caution! This is a caution admonition.	Definition: A Definition with a very long title that spans multiple lines This is a definition admonition.	Example: With a title This is an example admonition.	Support for Notes Text above the note. Notes are floated to the right w.r.t. the content that follows the note. Often, notes are explicitly sized using the <code>:class:</code> <code>width-<Percentage></code> option. No This is a note.
!DANGER! This is a danger admonition.	Proof This is a proof admonition.	Summary This is a summary admonition.	
Error This is an error admonition.	Theorem This is a theorem admonition.	Legend This is a legend admonition.	
Hint This is a hint admonition.	Repetition This is a repetition admonition.		
Important This is an important admonition.	Lemma This is a lemma admonition.	Question This is a question admonition.	Tip This tip is shown below the not because the class <code>clear-float</code> used to <i>clear the float</i> of the no Example <pre> 1 .. note:: 2 :class: width-40 3 4 This is a note. 5 6 Text that is left of the 7 8 .. tip:: 9 :class: clear-float 10 11 This tip is shown ... </pre>
Tip This is a tip admonition.	Conclusion This is a conclusion admonition.	Answer This is an answer admonition.	
Warning This is a warning admonition.	Observation This is an observation admonition.	Remember This is a remember admonition.	

SVGs can easily be embedded directly in RST documents. Direct embedding has the advantage that animation is then possible.

Code

Sizing of SVGs

Most basic Example

External SVGs

```
.. definition:: A Definition with a very long title that spans multiple lines
```

Usage: *slide view and document view*

This is a definition admonition.

In general, SVGs should be designed with the slide view in mind. They will automatically be scaled in the document view based on the font-ratio between the base font size used in the slide view and the base font size used in the document view.

Usage: *document view only*

SVGs shown only in the document view (e.g. solutions to exercises) should be designed with the document view in mind and hence should use the base font size of the document view as the foundation.

Embedded SVGs

They should be designed independent of any specific size and only use relative sizing. This ensures that they look beautiful in all contexts.

(See the respective example for more details.)

Basic Example

Example

SVG

```
1 .. xaw:: html
2
3     <div style="width: 5ch; height: 5ch;">
4     <svg   viewBox="0 0 5 5"
5         font-size="2"
6         version="1.1"
7         xmlns="http://www.w3.org/2000/svg">
8         <rect x="0.5" y="0.5" width="4" height="4" fill="darkblue"/>
9         <text x="0.75" y="3" fill="white">SVG</text>
10    </svg>
11 </div>
```

Markers and Styles

Embedded SVGs Only

!! Important

A single SVG in an rst source file, will be found at least three times in the HTML: In the document view, the slide view, and the lighttable view.

▲ Attention!

IDs: If an SVG uses `ids`, they are no longer unique which may cause rendering issues (in particular with Firefox). Therefore SVG elements with `ids` (typically markers) need to be defined using shared definitions.

Styles: Note that all styles defined in an SVG are global and affect all elements. Therefore, it is recommended to define them once using the `:svg-defs:` meta information tag.

Shared definitions in LD-rst documents:

Example

```
1 .. meta::
2     <other meta information>
3     :svg-style:
4         g.graph {
5             circle{
6                 fill: var(--current-fg-color);
7                 stroke-width: 0.2;
8
9                 &.red { fill: red;}
10                &.green { fill: green; }
11                &.blue { fill: blue; }
12                &.start-node {
13                    fill: none;
14                    stroke: red;
15                    stroke-width: 0.3;
16                }
17            }
18        }
19     :svg-defs:
20     <marker
21         id="arrow"
22         viewBox="0 0 2 2"
23         refX="1.8"
24         refY="1"
25         markerUnits="strokeWidth"
26         markerWidth="6"
27         markerHeight="6"
```

```

28         orient="auto-start-reverse">
29         <path class="arrow-head" d="M 0 0 L 2 1 L 0 2 z" fill="context-stroke" />
30     </marker>

```

Font-size dependent SVGs

LectureDoc generally distinguishes between the slide view and the document view. Both views represent the content in similar ways, but the slide view is optimized for presentation and generally uses a much larger font size (e.g., 48px) while the document view uses a smaller font size (e.g., 14px or 16px). Hence, it is recommended to draw an SVG using a font-size of 1 (no unit!) and to put the SVG in a fixed sized container where the size of the container depends on the font-size.

```

1  .. code:: html
2
3      <div style="width: 5ch; height: 5ch;">
4          <svg      viewBox="0 0 5 5"
5              font-size="1"
6              version="1.1"
7              xmlns="http://www.w3.org/2000/svg">
8              <rect x="0.5" y="0.5" width="4" height="4" fill="darkblue"/>
9              <text x="1.75" y="3" fill="white">SVG</text>
10             </svg>
11         </div>

```

Code Blocks

Use the standard `.. code::` directive to create a code block.

Numbering Lines

LD2 extends the standard reStructuredText code directive to ensure proper alignment of subsequent line numbers if a listing is split up in multiple code blocks or if multiple listings are shown on a single slide.

```

1  void main() {
2      // 1. Create and initialize a heap
3      var heap = new Heap<String>(String.class, 5);
4      heap.insertAll("dies", "ist", "ein", "test");
5      // 2. Remove elements and print them
6      while (heap.nonEmpty()) {
7          String s = heap.remove();
8          IO.println(s);
9      }
10 }

```

```

1  .. code:: java
2      :line-number-digits: 2
3      :class: head no-margin
4
5      void main() {
6          // 1. Create and initialize a heap
7          var heap = new Heap<String>(String.class, 5);
8          heap.insertAll("dies", "ist", "ein", "test");
9
10
11  .. code:: pascal
12      :number-lines: 5
13      :class: tail incremental-code
14
15          // 2. Remove elements and print them
16          while (heap.nonEmpty()) {
17              String s = heap.remove();
18              IO.println(s);
19          }
20      }

```

The classes: `head`, `tail`, and `snippet`

To control the rendering of the line numbers, a code block that represents only the start of a code should get the class `head` and a code block that represents only the end of a code should get the class `tail`, and a code block that is neither the start nor the end of a code block should get the class `snippet`

Copy to Clipboard

Add `copy-to-clipboard` to a code block to enable copying code to the clipboard.

Example

```

.. code:: java
   :class: copy-to-clipboard

   public static void main(...)

```

Supplemental Information

Use the supplemental directive for information that should not be directly shown on the slide, but should be integrated in the document. If the supplemental information is considered regular information in the document view - i. e., it should not be distinguishable from the main content - use the optional option `:embed-in-document-flow:`

Example

 Example

```
.. supplemental::
  :embed-in-document-flow:
```

This is supplemental information.

<Supplemental Information>

Vertical Titles TODO

Add the class `vertical-title` to rotate the title and to change the layout of the slide to a column-based layout. To get back to a row based layout add a container with the class `width-100`.

Examples

```
.. class:: vertical-title
```

```
<Slide Title>
-----
```

```
.. container:: width-100
```

```
<Row based content layout.>
```

Slide Tweaks

Slide without Title

To hide the title of a slide assign the class `no-title`.

Vertically Centered Content

Use the class `center-content`.

Examples

```
.. class:: center-content
         no-title
```

```
Hidden on the slide!
-----
```

```
<Slide Content>
```

Sections and Subsections

Create a slide that marks the beginning of a new section or subsection by adding the class `new-section` or `new-subsection` to the slide.

Exercises and Solutions

Associate the class `exercises` with a slide to indicate that the slide contains an exercise.

Use the directive `.. exercise::` to add an exercise. To add a solution use the custom directive `.. solution::` inside of an exercise block and specify the password (optional) using the attribute `:pwd:`.

Example (Solution in supplemental information)

```
.. exercise:: <Title>
```

<Description of the exercise.>

```
.. solution:: <Title>
```

```
:pwd: 1234
```

<Solution>

You can configure a master-password using meta information:

```
.. meta::
```

```
:master-password: <Master-password>
```

Table of Contents

A navigable table of contents can be created using standard `rst` techniques.

Example

Table of Contents

- `Section 1 Title`_

- `Subsection 1.1 Title`_

Footnotes

[#]_ and .. [#]_ create footnotes.

Test\ [#]_

```
.. [#]_ `test.org`
```

Explicit Footers

A container with the class `footer-left`, `footer-right` or `block-footer`.

References

Use standard `rst` references.

Example

```
...
```

Like described in [Eic24]_ ...

```
...
```

References

```
.. [Eic24]_ LectureDoc2; 2024
```

Fade-out Content

Add the class `fade-out` to a container to whiten the content.

Text Alignment

Control text alignment: `text-align- [left | center | right]`

Images

Adding a drop-shadow and rounded corners: picture.

Tables

The layout can be adapted using: `compact`, `compact-cells`, `no-table-borders`, `no-inner-borders`, `no-column-borders`, `fake-header [-2nd] -row` and `fake-header [-2nd] -column`.

Animation

`incremental` (and `wobble`).

`highlight-line-on-hover` (always usable), `highlight-on-hover` (explicit column or row headers are not supported) or `highlight-identical-cells`

Lists

■ `list-with-explanations` renders text paragraphs of list items less pronounced.

(As shown here.)

■ Use `impressive` to make the list more impressive:

■ Add `negative-list` to use "❗" for bullet points.

■ Add `positive-list` to use "✔" for bullet points.

Example

- Point 1

```
.. class:: negative-list list-with-explanations
```

- Point 2

Some on-slide explanation.

```
.. class:: positive-list
```

- Point 3

Decorations

`line-above` draws a horizontal lines.

`box-shadow` adds a shadow.

`rounded-corners` the corners will be rounded.

Example

```
.. container:: margin-top-1em
    line-above
    padding-top-1em
    box-shadow
```

Text

Font Styling

"rem" based relative sizes: `xxl`, `huge`, `large`, `small`, `footnotesize`, `scriptsize`, `tiny`, `x-tiny`, `xx-tiny`

"em" based relative sizes: `larger`, `smaller`, `far-smaller`

Font weight: `bold`, `light`, `thin`

Font family: `monospaced`, `serif`

Font style: `italic`

Slide Transitions

Available slide transitions: `transition-move-left`, `transition-scale`, `transition-fade`, `transition-move-to-top`

Example

```
.. class:: transition-move-left
```

<Slide Title>

Revealing Slide Content

All elements with the class `incremental` are revealed incrementally.

Example

```
.. class:: incremental
```

- Item 1 - Part 1

:*incremental*: Item 1 - Part 2

- Item 2

Column-based Layouts

Use `two-columns` and `three-columns` for respective layouts.

Example

```
.. container:: two-columns
```

```
.. container:: column no-separator
```

<Column 1>

```
.. container:: column
```

<Column 2>

Add `no-default-width` to the root container for content based column widths. Use class `no-separator` on the left column to remove the separator.

Stacked Layouts

Stacked layouts are based on nested layers. Each layer - except of the first one - needs to have the class `incremental` and/or the class `overlay` for transparent layers. (Up to 10 layers are supported.) To turn off the numbering of opaque layers use `.no-number`.

Images in Stacked Layouts

To avoid that a parent element of a floating element is collapsed add the class `clearfix` to the parent element; i. e., when a layer just contains a floating image.

Example

```
.. deck::
```

```
.. card:: clearfix
```

```
.. image:: <p1.svg>
:align: left
```

```
.. card:: overlay
```

```
.. image:: <p2.svg>
```

```
.. card:: warning
```

Semantic-based Text Markup

`peripheral`: for less important text. `obsolete`: for obsolete statements. `ger`: to markup German Words.
`eng`: to markup English words.

Box sizes

Use `width-100%` and `width-75%` to control the width of a container.

Colors (`roles`)

Font Colors

`red`, `gray`, `light-gray`, `blue`, `green`, `black`, `white`, `shiny-green`, `shiny-red`

Background Colors

`red-background`, `dhbw-gray-background`, `dhbw-light-gray-background`, `white-background`,
`blue-background`, `light-green-background`, `green-background`, `yellow-background`

Example

`:dhbw-red: 'Red Text.'`

Fine-grained Control (Try to avoid!)

`margin-none`, `margin-0-5em`, `margin-1em`, `margin-top-1em`, `margin-top-2em`, `margin-bottom-1em`,
`margin-bottom-2em`, `margin-right-1em`, `margin-left-1em`, `padding-none`, `padding-0-5em`,
`padding-1em`, `padding-top-1em`, `padding-top-2em`

Hiding slides (⚠ `rst2ld` only)

Use `hide-slide` to exempt it from slide generation.

Example

`.. class:: hide-slide`

<Hidden Slide >

Configuration

LectureDoc meta information:

`id` The unique identifier for the slide set. Required to store the current state of the presentation.

`slide-dimensions` the slides dimension (default: "1920x1200").

`first-slide` Determines the first slide that is shown (e.g., <Slide Number> or "last-viewed").

Example

```
.. meta::
  :id: <unique id>
  :slide-dimensions: 2560x1440
  :first-slide: last-viewed
```

Cheat Sheets with LD²

A cheat-sheet is a slide with the class `cheat-sheet-8-columns`.

Template

```
.. class:: cheat-sheet-8-columns

<Title>
-----

.. container:: cheat-sheet-block

.. rubric:: <TOPIC>

.. rubric:: <SUB-TOPIC>
```

Useful Role and Substitution Definitions

Template

```
.. role:: incremental
.. role:: eng
.. role:: ger
.. role:: peripheral
.. role:: obsolete
.. role:: red
.. role:: gray
.. role:: light-gray
.. role:: blue
.. role:: green
.. role:: orange
.. role:: shiny-green
.. role:: shiny-red
.. role:: dark-red
.. role:: black

.. role:: raw-html(raw)
:format: html
```
